

Job Description Form

10-April 2026

Intern, AI - Software Quality Assurance

Date

Position Title

The job responsibilities outlined in this document are not exhaustive and may evolve over time and be reviewed according to business needs.

ROLE DESCRIPTION SUMMARY

Support the QA team in introducing first hands-on use of AI to improve test design, execution, and defect analysis across products and services. The intern will assist in evaluating AI-assisted testing tools and techniques, building small proof-of-concepts, and documenting learnings and recommendations for wider adoption. The role contributes to higher test efficiency, improved coverage, and earlier risk detection while ensuring quality, security, and compliance are maintained.

PRIMARY RESPONSIBILITIES / KEY RESULT AREAS

Approximate allocation over a year (may vary by project phase):

- AI-in-QA discovery & requirements (15%): Identify candidate QA activities for AI support (e.g., test case authoring, test data generation, log/defect triage), capture pain points, success criteria, and constraints (data privacy, IP, tooling).
- Proof-of-concept development (25%): Build and iterate small prototypes (scripts/note-books/tools) to demonstrate AI-assisted testing workflows, e.g., generating test ideas from requirements, clustering failures, summarizing test results, or creating test data within allowed policies.
- Test automation support & integration (20%): Extend or refactor automated tests (UI/API) and integrate AI-generated artifacts responsibly (prompt templates, structured outputs) into existing pipelines where appropriate.
- Evaluation & benchmarking (15%): Define and run comparisons against baseline approaches (accuracy, coverage, time saved, false positives/negatives), and track findings in an experiment log.
- Quality governance & risk controls (10%): Apply guardrails such as data minimization, anonymisation, secure handling of test data, and documentation of limitations/bias; ensure outputs are reviewed and reproducible.
- Documentation, knowledge sharing & enablement (15%): Document workflows, create “how-to” guides and reusable prompt patterns, and share results in demos/short presentations to the QA team.

COMPETENCIES

Functional and behavioural competencies for this role include:

Job Description Form

- QA fundamentals: Understanding of test levels (unit/integration/system), test design techniques, defect lifecycle, and basic quality metrics.
- AI/LLM literacy: Ability to apply prompt engineering basics, evaluate output quality, recognise hallucinations, and design human-in-the-loop review steps.
- Data handling mindset: Awareness of privacy/security principles (e.g., avoid sensitive data in prompts, use approved environments, document data sources).
- Scripting/automation: Practical ability to write or adapt scripts (e.g., Python) and/or test automation (e.g., Playwright/Selenium/Cypress) with clean, readable code.
- Analytical problem solving: Ability to analyse test failures, logs, and metrics; propose hypotheses and validate them through experiments.
- Communication & documentation: Clear writing of experiment notes, assumptions, limitations, and step-by-step guides; concise reporting of results to stakeholders.
- Collaboration & learning agility: Works effectively with developers, QA engineers, and product owners; open to feedback and iterates quickly.
- Acts independently once tasks are assigned and initial guidance is provided by local support.
- Plans and executes work within defined QA processes, documents progress and results, and escalates risks, blockers, or data/privacy concerns early.
- Open personality; willing to learn; proactive “doer”; communicative and collaborative team player; motivated to contribute and make a measurable difference.
- Ownership and integrity: Follows through on commitments, escalates risks early, and adheres to engineering and compliance standards.

QUALIFICATIONS & EXPERIENCE

Required qualifications and experience (intern level):

- Education (minimum): Currently enrolled in a Bachelor’s or Master’s program in Computer Science, Software Engineering, Data Science, Electrical Engineering, or a related field.
- Technical foundation: Basic programming knowledge (preferably Python and/or Java/JavaScript) and familiarity with Git and CI concepts.
- Testing exposure: Coursework, project, or internship experience with software testing, test automation, or QA processes (academic projects acceptable).
- AI exposure: Demonstrated interest or initial experience with AI/ML and/or generative AI (e.g., university project, hackathon, personal project) including basic understanding of model limitations and evaluation.
- Preferred (nice to have): Experience with API testing tools, test frameworks (pytest/JUnit), UI automation (Playwright/Selenium), and/or working with structured data (CSV/JSON) and logs.
- Language/communication: Able to communicate clearly in English (written and spoken) and document work in a structured way.

OTHER KEY REQUIREMENTS / COMMENTS

Job Description Form

SES and its Affiliated Companies are committed to providing fair and equal employment opportunities to all. We are an Equal Opportunity employer and will consider all qualified applicants for employment without regard to race, color, religion, gender, pregnancy, sex, sexual orientation, gender identity, national origin, age, genetic information, protected veteran status, disability, or any other basis protected by local, state, or federal law.
